

Dish of the day!

Onlime is a specialist provider of Business Communications, whether over satellite or fibre. The Onlime sales and projects team will evaluate your requirements and suggest cost effective solutions to meet your objectives, using one or more of the many technical solutions available from our Teleport. We can provide dedicated (SCPC) links to your site or create a pool of bandwidth using our iDirect® hubs to deliver contended services across several sites. The Enterprise Class solutions are both flexible and scalable to cope with growth within your organisation. We guarantee you a quality connection and 24/7 support from our multilingual Network Operations Centre (NOC).

IP Trunking

Onlime provides high capacity point-to-point links for delivery of Internet to mobile operators, ISPs, as well as to enterprises with high data requirements.

Fibre Restoration

With the rapid growth of fibre networks in developing countries a back-up solution is vital to secure continuing communications. In the early stages of fibre expansion, the networks tend to be single thread, which means one break in the chain can cease services. Fibre restoration via Satellite is ideal to provide the security you need and Onlime can provide you with a very cost effective solution.

Cellular Backhaul

Satellite connectivity has changed the potential to deliver cellular communications to the rural populations of the developing world. The biggest obstacle in the developing world remains how to avoid building endless towers and base stations in locations that don't serve communities only to provide the backhaul to genuinely remote communities. Cellular providers now have a cost-effective backhaul solution with iDirect® IP-based D-TDMA hub, which allows carriers to share network capacity across multiple locations, allocating bandwidth on demand to maximise efficiency. With iDirect, there are unprecedented cost savings, which best preserves and protects the cellular traffic to ensure the highest standards of availability and call quality.

By leveraging the efficiencies of an IP platform and iDirect's shared topology, operators can significantly reduce operating expenses and expand the reach of their network.

Terminal Services

Onlime can provide a variety of standalone options for satellite communications from the remote team exploring in the desert to the emergency requirements of a disaster relief team heading into the unknown and with an urgent requirement for reliable communications.

Flyaways

Broadcasting from a remote location is easily solved through deployment of a "Flyaway" satellite system. Based on iDirect technology, the Ku-band mobile antenna system can be set up single-handedly in no time at all and requires very little training. The system can be trailer or vehicle mounted or set up on the ground. Once powered up it will automatically lock on to the satellite.

Comms on the Move

Onlime provides continuous, reliable satellite communications whilst on the move. Whether for military manoeuvres or disaster relief, Onlime will keep you connected.

Rapid Deployment

If disaster strikes and you need to re-establish business continuity urgently, Onlime has experienced field partners throughout Europe who can deploy iDirect based services at short notice (24-48 hours) for short or long term contracts. Services include supply, installation and commissioning with Internet or MPLS connectivity.

Uplink

The Teleport is fully equipped to uplink services in C and Ku-band to a wide variety of satellites, whether for data or broadcast. All uplinks are monitored by our 24/7 NOC and the teleport has extensive redundancy facilities. We operate under strict SLAs and guarantee to provide a quality service.

Downlink

The Teleport has extensive downlink facilities and as an example we currently downlink television channels from satellites outside the reach of broadcasters and then deliver the content in ASI or IP formats over fibre to their facilities in other parts of the world.

24/7 Network Operations Centre

The Teleport is home to an ultra-modern multilingual and multinational 24/7 Network Operations Centre (NOC). The NOC is responsible for managing and monitoring every aspect of the Teleport operations, and plays a vital and proactive role in making sure that our customers receive the highest level of technical support.

We monitor our customer's services around the clock and communicate promptly to resolve any issues.

Project Management

A key part of the Onlime commitment is to ensure that we deliver what we promise. We have a dedicated Project Management team based in Hameln and in our UK offices whose responsibility it is to make sure deadlines are met; budgets are adhered to; and we deliver the highest quality of service expected of us.

Remote Support

We are very much aware of the need to be "close to our customers" and have either set out to have our own support staff on the ground or have built up a network of highly reliable support engineers in the countries and territories where we operate. Remote support is coordinated by our 24/7 NOC and you can rely on us to respond promptly or within timeframes specified in your SLA.
